

Micro-MAG

Organic Magnesium Fertilizer

Mg
20.0%

Micro-MAG is a micronised form (< 5 micron) of Magnesium Carbonate in a complex with Fulvic acid to enhance nutrient availability, delivery and utilisation in a liquid suspension.

Micro Liquid Suspensions

The **Micro Liquid Suspension** products are based on micronised minerals which have been highly processed into minute particles less (than 5 microns) and blended with a range of organic suspension agents including Fulvic acid.

Unlike other liquid Lime, Dolomite, Gypsum products, where the Calcium relies on the reaction with soil acidity to begin its release process. The Micro range, by virtue of their association with organic chelating agents, are 'pre-condition' for immediate release. This increases their availability and uptake, making these products suitable for both foliar or soil applications.

- Magnesium is essential for photosynthesis.
- Magnesium is a phosphate synergist.
- Magnesium should always be maintained at luxury levels in the leaf for maximum yield and plant health.
- Contains more than twice as much Mg as any soluble Magnesium alternatives.
- Features a slow-release which feeds the plant for a longer period.
- Enables the build up of tissue Magnesium, without unwanted Sulphate or Nitrates.
- **Micro-MAG** is ideal for light, sandy soils.

Application Rates: (min foliar dilution 1 : 50)

Turfgrass applications:

Apply to soil at 1 - 3 litres/1000m² or foliar at 250 - 750 ml/1000m².

General landscape use (trees, shrubs, garden areas, including natives):

Apply to soil at 1 - 3 litres/1000m² or foliar at 250 - 750 ml/1000m².
